$\left.\mathrm{H}^{+}(a q)+\mathrm{OH}_{(a q)}^{-} \rightarrow \mathrm{H}_{2} \mathrm{O}_{( } \ell l\right)$
A student is asked to determine the molar enthalpy of neutralization, $\Delta H_{n e u t}$, for the reaction represented above. The student combines equal volumes of 1.0 M HCl and 1.0 M NaOH in an open polystyrene cup calorimeter. The heat released by the reaction is determined by using the equation $q$ $=m c \Delta T$.
Assume the following.

- Both solutions are at the same temperature before they are combined.
- The densities of all the solutions are the same as that of water.
- Any heat lost to the calorimeter or to the air is negligible.
- The specific heat capacity of the combined solutions is the same as that of water.
(a) Give appropriate units for each of the terms in the equation $q=m c \Delta T$. (2 pts)
(b) List the measurements that must be made in order to obtain the value of $q$. ( 2 pts )
(c) Explain how to calculate each of the following.
(i) The number of moles of water formed during the experiment (1 pt)
(ii) The value of the molar enthalpy of neutralization, $\Delta H_{\text {neut }}$, for the reaction between HCl (aq) and $\mathrm{NaOH}_{(a q)}(2 \mathrm{pts})$
(d) The student repeats the experiment with the same equal volumes as before, but this time uses 2.0 $M \mathrm{HCl}$ and 2.0 M NaOH .
(i) Indicate whether the value of $q$ increases, decreases, or stays the same when compared to the first experiment. Justify your prediction. (1 pt)
(ii) Indicate whether the value of the molar enthalpy of neutralization, $\Delta H_{\text {neut }}$, increases, decreases, or stays the same when compared to the first experiment. Justify your prediction. (1 pt)
(e) Suppose that a significant amount of heat were lost to the air during the experiment. What effect would this have on the calculated value of the molar enthalpy of neutralization, $\Delta H_{\text {neut }}$ ? Justify your answer. (1 pt)

(b) The heat of combustion of propane is $-2,220.1 \mathrm{~kJ} / \mathrm{mol}$. Calculate the enthalpy of formation, $\Delta H_{f}^{o}$, of propane given that $\Delta H_{f}^{o}$ of $\mathrm{H}_{2} \mathrm{O}(\ell)=-285.3 \mathrm{~kJ} / \mathrm{mol}$ and $\Delta H_{f}^{o}$ of $\mathrm{CO}_{2}(\mathrm{~g})=-393.5 \mathrm{~kJ} / \mathrm{mol}$.
